What's new with

a zvoove company.

## Cleaning
Unit number
The unit number is now visible in several places. This way different rooms are easier to distinguish from each other and are sorted in the correct order.
Soon we will extract (where desired) the unit numbers originally added in the titles.

Contact support

End of the day to 3:00
Tasks that have not been completed in a time for work schedules, are automatically cancelled around 00:00. Because some locations have shifts that span two days and extend past 00:00, this time has been adjusted to 3:00.
Daily and weekly tasks visible

In the list of units with regular tasks, it is from now on possible to see at a glance how many daily and weekly tasks are listed per unit.
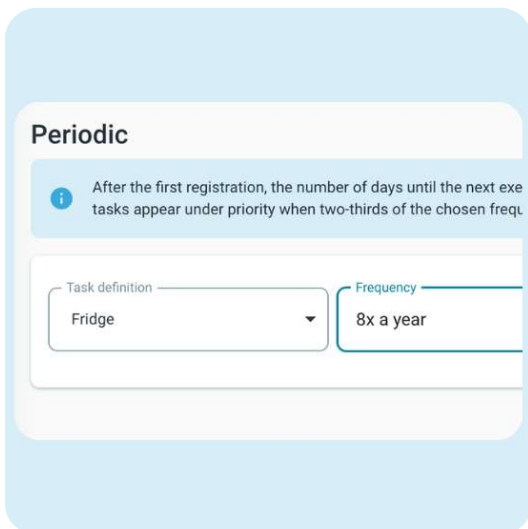

New periodic frequency

For periodic tasks, an additional frequency of 8 times per year has been made possible.

Parts filter more intuitive

In the list of units with regular tasks, the sharing filter has been split up. It's now possible to filter sharing per layout. Instead of clicking on **Parts**, you now click on **Blocks**, **Building Parts**, **Floors**, or **Zones**. This way, you can also easily combine parts from different layouts.

You can reflect the structure of an object in Leviy by using Layouts and Parts. Layouts could be Building Parts, Zones, or Floors, for instance. Within each Layout, you can specify the parts, such as 'North Building Part' and 'South Building Part' for the 'Building Parts' layout. This setup

is reflected in various functionalities, such as the cleaner's task list, notifications, or analyses.

Task and definition display

For better readability, the titles and descriptions of the task definitions have been merged in the overview of each work schedule.

Work tickets
Status and time

For work tickets and services, the overview have been expanded to include more detailed statistics, such as the status, date and time when this status was obtained.

View underlying services

In the new overview of work tickets, the number of services is displayed in the list. This is clickable, allowing easy access from the desired work ticket to the underlying services.
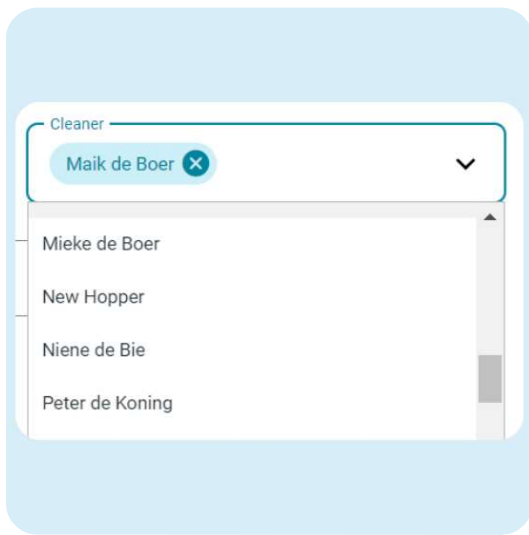

Filter assigned employee

In the overview of services, you can now filter on assigned employee. This allows for a clear view of who is assigned to which task, so you can make adjustments or changes where necessary.
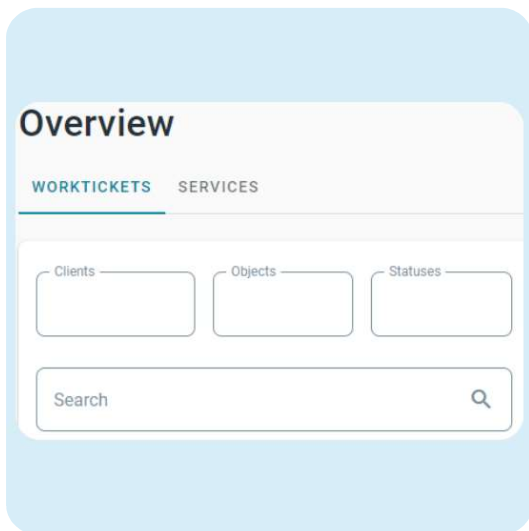

Search and filterering

Previously, it was possible to search by different characteristics. To support multiple combinations, some have been replaced by ready-made filters and search options have been added. From now on, the search bar is reserved for searches on work ticket number, service title, and service description.
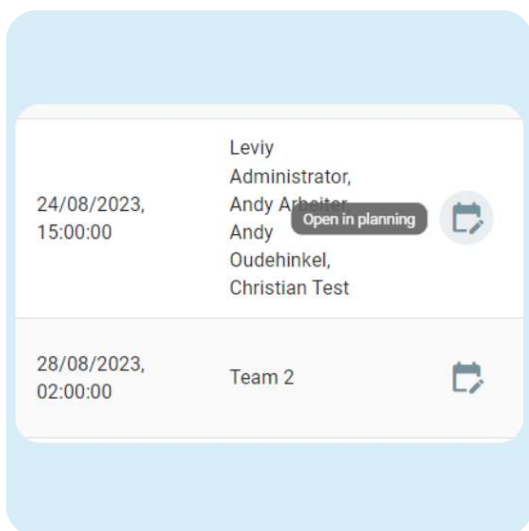

Easily make changes

From the overview of services, it's now possible to navigate to the planning for per service. This allows for easy implementation of necessary changes.

Read more in our release notes

As communicated earlier, we've been working on more frequent updates to our platform over the past months. Many newly developed features are now immediately available rather than following our historical 5-week cycle. Starting in 2024, we will standardise this approach for all new features and

adjustments. In line with this change, the methodology for release notes and product newsletters will also be modified: **from now on, we will communicate the innovations on a monthly basis.**

See you next release!

Team Leviy
